

So I chose Google. On their about page they list the goal of the company as “Our mission is to organize the world’s information and make it universally accessible and useful” (about.google/company-info). Currently that goal is manifesting in the researching and development of a lot of generative AI tools. This is partially because of their expansive indexing and scraping of the internet. I chose their most recent instagram post as it is a video so there is a little more to talk about.

(https://www.instagram.com/reel/DLDULxQRUae/?utm_source=ig_web_copy_link&igsh=MzRlODBiNWFiZA==)

The video demonstrates their generative AI tool that is capable of parsing a prompt as well as images and crafting a story from them, the most recent version of Gemini. It has great sound design music and sfx that makes it seem kind of novel and fun. That seems to be the common presentation of software like this that allows for sort of novel/art adjacent products of AI tools. The AI tooling makes accessing internet simpler in the way that having an AI trained to make art, one in a way has access to all the art skills and knowledge on the internet. Although that knowledge is hidden behind API calls and is not acted on by the human. Google continually demonstrates an accessible business casually kind of brand. One that everyone knows but doesn’t take itself too seriously. A vibe that seems pretty synonymous with Silicon Valley tech brands.
